Khatri-Rao Product

Problem 1 Generate $\mathbf{X} = \mathbf{A} \diamond \mathbf{B} \in \mathbb{R}^{I \times R}$, for randomly chosen $\mathbf{A} \in \mathbb{C}^{I \times R}$ and $\mathbf{B} \in \mathbb{R}^{I \times R}$. Compute the left pseudo-inverse of \mathbf{X} and obtain a graph that shows the run time vs. number of rows (I) for the following methods

- (a) Method 1: Matlab/Octave function $\text{pinv}(\mathbf{X}) = \text{pinv}(\mathbf{A} \diamond \mathbf{B})$
- (b) Method 2: $\mathbf{X}^\dagger = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T = [(\mathbf{A} \diamond \mathbf{B})^T (\mathbf{A} \diamond \mathbf{B})]^{-1} (\mathbf{A} \diamond \mathbf{B})^T$
- (c) Method 3: $\mathbf{X}^\dagger = [(\mathbf{A} \diamond \mathbf{B})^T (\mathbf{A} \diamond \mathbf{B})]^{-1} (\mathbf{A} \diamond \mathbf{B})^T = [(\mathbf{A}^T \mathbf{A}) \odot (\mathbf{B}^T \mathbf{B})]^{-1} (\mathbf{A} \diamond \mathbf{B})^T$

Note: Consider the range of values $I \in \{2, 4, 8, 16, 32, 64, 128, 256\}$ and plot the curves for $R = 2$ and $R = 4$.

Problem 2 Generate $\mathbf{X} = \bigodot_{n=1}^N \mathbf{A}_{(n)} = \mathbf{A}_{(1)} \diamond \cdots \diamond \mathbf{A}_{(N)}$, where every $\mathbf{A}_{(n)}$ has dimensions 4×2 , $n = 1, \dots, N$. Evaluate the run time associated with the computation of the Khatri-Rao product as a function of the number N of matrices for the above methods.

Note: Consider the range of values $N \in \{2, 4, 6, 8, 10\}$.

\odot Denotes the Hadamard Product.
 \diamond Denotes the Khatri-Rao Product.
